“Which Agglomeration Externalities Matter Most And Why?”

by Henri L.F. de Groot, Jacques Poot and Martijn Smit

Journal of Economic Surveys, forthcoming

This document contains the following information:

- Table A1: an ordered probit analysis of the more heterogeneous full dataset, which can be directly compared with the previous results obtained with the smaller dataset that was used in De Groot et al. (2009);
- Tables A2–A4: marginal effects for the three estimated equations reported in Table 2;
- Tables A5–A8: Fixed Effect and Random Effect average weighted effect sizes of Fisher z-statistics, the corresponding 95 percent confidence intervals, and their regressions matching Table 3;
- Figures A1–A3: funnel plots based on the Fisher statistics.

Table A1: Ordered probit results including sector-specific estimates

Table A5: FE estimates

Tables A5 to A8 and Figures A1 to A3 report the results of our meta-analysis in which the t -values of the regression coefficients of indicators of specialization, competition and diversity in the primary studies have been replaced by Fisher's z -values, using the formulae in Poot (2014, p. 245, Meta-analysis of previous empirical research findings. In: R.J. Stimson (ed.), *Handbook of Research Methods and Applications in Spatially Integrated Social Science*. Cheltenham: Edward Elgar). Each of these Fisher z -values acts as an effect size, with the standard error approximated by the reciprocal of the square root of the primary study's number of observations minus three. The effect sizes and their standard errors were used to calculate inverse variance weighted fixed effect (FE) and random effects (RE) averages using the software provided by Stata (see Sterne, J.A.C. (2009). *Meta-Analysis in Stata: An Updated Collection from the Stata Journal*, Stata Press). Meta-regression models, that correspond with the WLS regressions in Table 3 of the paper, were also estimated with the software (FE and RE in Tables A6 and A8 respectively). Finally, Figures A1 to A3 report the corresponding funnel plots. In all tables below, the indented ID's in first column refer to the following study IDs:
